FARM EMPLOYMENT DOWN SEASONALLY; WORK DAY SHORTER

About 1.5 million fewer persons were employed on farms on December 1 than a month earlier, the United States Department of Agriculture reported today. There were 9,245,000 persons engaged in farm work around the first of this month, compared with 9,337,000 a year earlier. With field work for the year about finished in most areas, farmers and their hired hands were working shorter hours than on September 1. Farm operators averaged 10.6 hours of work per day, while hired workers averaged 9.1 hours on the first of December, compared with September 1 averages of 11.9 for operators and 9.9 for hired hands. December 1944 averages were 10.8 for farm operators and 9.3 for hired workers.

There was still some corn to be picked in the Northern States, with progress slow because of wet weather. Cotton picking was only 82 percent complete by December 1, compared with a 10-year (1934-43) average of 93 percent, and was especially late in Missouri, Arkansas, and Tennessee. Harvest of winter vegetables and the citrus crop continued in the extreme South.

The number of hired workers employed on December 1, at 2,028,000, was 21 percent less than on November 1. Large decreases were general in all Regions -- the largest 41 percent in the Mountain States and 34 percent in the Pacific Region. In the West South Central States, the number was only about 4 percent lower. Hired employment on the first of the month was slightly under December 1 a year ago. In most regions it was the same or lower, with the largest decline in the East South Central States. However, in the Middle Atlantic and West South Central States, the number was larger.

Family employment declined 12 percent during November to 7,217,000 on December 1, with fewer family workers employed in all Regions. Decreases were largest in the South. The number of family workers on December 1 was slightly smaller than a year earlier. Slight increases in the Middle Atlantic and North Central States were more than offset by decreases elsewhere.

In the New England States, farm work consisted mainly of chores and care of livestock. Some woods work was started in the northern States after the snow in late November. Total employment about December first, 215,000 was down 5 percent from the previous month, but the same as last year. Family employment showed little change from either last month or last year. The number of hired workers decreased from the 70,000 on November 1 to 60,000, the same as a year earlier. Farm operators were working 11.4 hours per day, the longest hours in any region, while hired workers were putting in 9.8 hours.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

Farm employment in the Middle Atlantic States dropped over 10 percent from November 1 to a total of 589,000 on December 1, but this was 2 percent above a year earlier. The decrease during November amounted to 5 percent for family workers and 22 percent for hired workers. Family and hired workers both numbered more than a year earlier on the first of December. Outside work was nearly at a standstill. Cold, snowy, weather halted the completion of the small amount of soybean threshing and corn husking still to be done in New Jersey. Chores and other inside jobs were still keeping farm operators busy for 11.2 hours per day and hired workers 10.0 hours, slightly shorter working hours than a year ago.

Some corn still remained to be picked in the East North Central States around December 1, but the weather was unfavorable for rapid completion of the job. Family and hired employment both declined from a month ago -- family employment almost 6 percent and hired employment 11 percent. The number of family workers remained slightly above December 1944, but the number of hired workers dropped 5 percent. In this Region also, work days were somewhat shorter than around the first of last December.

Decreases from November 1, about 4 percent in the number of family workers and 16 percent in hired workers, brought total employment in the West North Central States to 1,486,000 persons on December 1. Total farm employment on December 1 was about the same as a year earlier. Regular year-around hands and farm operators were completing corn picking and doing chores and repair work. There was little work for extra hired labor, except for some corn picking not completed. Hours of work averaged 11.0 for operators and 9.6 for hired hands.

With more than 88 percent of the cotton picked, farm employment in the South Atlantic States dropped 22 percent from the first of November to 1,526,000 on December 1. The number of both family and hired workers decreased sharply. Total farm employment on the first of this month was slightly under a year ago; the entire decrease was in the number of family workers. Most major farm jobs were finished by the end of November. In Virginia, wet weather delayed corn husking, as well as the harvest of peanuts, soybeans and lespedeza seed. Pecan harvest was nearly finished in Georgia. In Florida, oranges and grapefruit were being picked in increasing volume. With the work slackening off, farm operators were working about an hour less per day than in September and a little less than a year ago. Hours of hired laborers were also a little shorter. Operators averaged 10.3 hours and hired workers 8.7 hours per day about December 1.

Harvest was about completed in the East South Central States by December 1. Tobacco stripping was in progress in Kentucky and Tennessee. Cotton picking was almost finished except in Tennessee, but there was still some corn to be harvested in northern Georgia. Both family and hired employment declined seasonally in the entire Region, with the bulk of harvest completed. There were 1,421,000 people employed on farms the first of this month, compared with 1,748,000 on November 1. The number of hired workers on December 1 was 13 percent smaller than a year ago. Family workers were also fewer, with total employment down about 4 percent. Work days around the first of the month averaged 10.2 hours for farm operators and 8.8 hours for hired workers.

The number of hired workers in the West South Central States, at 510,000, was 9 percent larger on December 1 this year than a year earlier, but 4 percent smaller than on November 1 of this year. Family employment showed about the

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

usual decline from the first of November to December 1, and was slightly under a year earlier. Continuation of cotton harvest into December in Arkansas was largely responsible for the larger-than-usual number of hired workers. Cotton was about all picked in Oklahoma and Texas. In Oklahoma, farmers were engaged in threshing peanuts and were doing some fall plowing. On the first of the month, farm operators and their hired hands were working shorter hours than in September. Operators were averaging 10.3 hours work per day and hired workers 8.8 hours.

Hired employment decreased about 40 percent in the Mountain States during November, somewhat more than usual. Family employment was down 6 percent, and all persons working on farms totaled 376,000 on December 1, a decrease of 18 percent from a month earlier. Farm employment was also down from a year earlier, with the number of hired workers showing the greatest percentage decrease. Practically all harvest work was completed by December 1 in this region, and most of the hired workers still employed were regular year-round hands. Work generally consisted of livestock care and preparations for winter.

The load of work in the Pacific States eased considerably during November. Harvest operations were about completed in Washington and Oregon. In California, cotton picking and citrus and vegetable harvest were the main jobs. Grape, olive, and sugar beet harvest were being completed. Farm employment on December 1 was 24 percent less than a month earlier. The number of family workers was 10 percent smaller and the number of hired workers 34 percent smaller. Total farm employment on the first of December was under a year earlier, with the number of both family and hired workers down. Hours of work per day followed the general trend, and were shorter than on both September 1 and December 1 a year ago.

Custom and piece-work rates for corn harvest were about twice as high for the 1945 crop as for the crop of 1938, the latest crop for which comparable data are available. The use of mechanical corn pickers has increased rapidly in recent years. A survey of corn harvesting practices for the 1943 crop showed that over 50 percent of the acreage in each of the States of Indiana, Illinois, Iowa and Minnesota was harvested with a mechanical picker. This harvest method has continued to increase the past 2 years, as the supply of farm labor has decreased.

Custom rates paid for mechanical picking averaged \$4.00 per acre this year and \$2.10 per acre for the 1938 crop. Variation in rates between States resulted from differences in services furnished, concentration of corn acreage and mechanical pickers, yields per acre, size of fields, and in the supply of and demand for farm labor. Rates usually include the corn picker, the power to operate it, and the operator. The hiring farmer usually supplies the wagons or trucks and the labor to haul the corn from the picker. Fuel is sometimes furnished by the owner of the machinery. This year rates were high in some areas because corn stalks were blown down or bent and pickers could operate in only one direction.

Piece work rates averaged 10.4 cents per bushel for hand-husking from the standing stalk and 11.9 cents for husking from the shock. In 1938, rates averaged 4.3 cents per bushel for husking standing corn and 5.8 cents for husking shocked corn. Rates of pay for husking corn from shock were generally higher than those for husking from standing stalk, because of the quantity that can be harvested per day is usually less when husking from shock. The method of husking corn by hand from the standing stalk was used in 1943 for harvesting over 50 percent of the corn acreage in the country. Husking from shock is most important in Pennsylvania, Delaware, Maryland, Virginia, West Virginia, and Kentucky.

EARNINGS OF HIRED FARM WORKERS IN SEPTEMBER
HIGHER THAN IN MARCH

Hourly cash earnings of hired farm workers averaged 40 cents during the week ended September 22, 1945, compared with 34 cents for the third week in March. The Bureau of Agricultural Economics has completed the September enumeration in a series of nationwide surveys of farm wages.^{1/} The following preliminary summary is based on reports from more than 6,000 farmers who hired labor during the third week of September in a national sample of 20,000 farms. Reports for hired workers employed in crews are not included in this summary. A more detailed analysis of wages and wage rates of all workers will be released at a later date.

Hired workers, excluding those in crews, averaged 67 cents per hour in the West, the highest cash earnings in any of the four regions.^{2/} Hourly earnings were lowest in the South at 34 cents and in the North Central States at 35 cents. In the Northeast, they averaged 42 cents. Hourly earnings were 5 to 10 cents higher in September than in March in all regions. For the entire country, workers receiving 2 or more meals per day earned 12 cents less per hour than those not receiving meals.^{3/} The difference in hourly earnings of workers receiving meals and those not receiving meals was 5 cents in the South and 28 in the West.

Earnings of hired workers on the farms reporting for the week ended September 22 averaged \$16.90. Some workers may have worked part of the time on other farms or at non-farm jobs, so that these average weekly wages do not represent the total weekly earnings of hired farm workers. Earnings for the week varied from \$33.80 in the West to \$11.20 in the South, and were near \$20 for the other two regions. Hourly earnings in the South were nearly the same as in the North Central region, but fewer days work during the week and shorter days held earnings for the week on the farms reporting to a lower level. In the South, workers receiving meals earned slightly more per week than those not receiving meals. Hourly earnings for workers not receiving meals were greater, but this group of workers averaged one-fifth fewer hours during the week. Large numbers of women and youth were employed part-time at cotton picking. This accounts, in part, for the shorter hours of workers not receiving meals. In the other regions workers not receiving meals also worked fewer hours during the week than workers receiving meals, but differences in hourly earnings were great enough so that weekly earnings of workers not receiving meals were somewhat larger.

Work-week shorter in September

Hired workers not employed in crews averaged 4.4 days of 9.5 hours during the week. In the West, hired hands averaged 5.5 days during the week on farms reporting, while in the South the average was 3.6 days. In the other Regions,

- 1/ The results of the March survey were published in Wages and Wage Rates of Hired Farm Workers, United States and Major Regions, March 1945, Survey of Wages and Wage Rates in Agriculture, Report No. 4.
- 2/ Northeast, New England and Middle Atlantic States; North Central, East and West North Central States; South, South Atlantic and East and West South Central States; West, Mountain and Pacific States.
- 3/ Includes the few workers receiving one meal per day.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

the average was 5.2 days. Hours of work per day were longest in the North Central States, where hired workers put in an average of 10.5 hours. Work-days were shortest in the South at 9.1 hours and in the West at 9.2 hours.

Workers receiving meals in addition to cash wages averaged a day more per week and an hour more per day than those not receiving meals. Workers receiving meals worked more hours during the week in every Region. Most workers receiving meals were regular hands, in contrast to seasonal workers hired for the duration of a specific job.

Hired workers, not including crew workers, generally averaged fewer days and hours of work per week in September than in March. A greater proportion of short-time seasonal workers were employed in September. Hours of work per day, however, were up slightly for the United States. In the Northeast and the West daily hours of work averaged slightly less in September, but longer work-days in the North Central Region and the South raised the national average.

Wage rates higher than in March

Wage rates for farm labor in the third week of September were up sharply from the week ended March 24. All types of wage rates in all Regions were higher, with only two minor exceptions, where they were the same. The higher rates in September reflect the much heavier demand for harvest labor. Monthly rates averaged \$77.10 with meals and \$109.00 without meals for the entire United States. Daily rates without meals averaged \$3.60 in September and \$2.65 in March, while hourly rates without meals averaged 59 cents, an increase of 4 cents over the March rate.

Women were hired for farm work much more generally in late September than in the latter part of March. Women made up 19 percent of the total hired workers, excluding crew workers, in the United States in September and only about 5 percent in March. In the South more than one-fourth of the hired workers were women, as cotton picking was in full swing in September. The percentage of women, about 4 percent, was lowest in the North Central States, and not greatly different from March. In the Northeast, women made up 7 percent of the total hired workers, and in the West 8 percent were women.

About one-fourth of the hired farm workers, excluding workers in crews, in the United States received 2 or more regular meals per day in addition to cash wages. Only about 10 percent of the hired workers in the South received meals. In the North Central States, where this practice is most common, about half the hired hands received meals. The September survey shows little change since March in the proportion of hired workers furnished meals.

The proportion of workers not in crews working at piece-work rates increased sharply from March. This increase was marked in all Regions, except the North Central where piece rates are seldom used in September except for crews. In the South, over 30 percent of the hired workers were paid piece rates. Most of the hired labor employed to pick cotton is paid on this basis. Fruit and potato harvest in the Northeast and fruit and vegetable harvest in the West were responsible for much piece-rate work in these areas.

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

Preliminary Results from Surveys of Farm Wage Rates
in Special Crop Areas

Peach and Prune Harvests in Yuba City Area, California:

Harvest workers housed in the Department of Agriculture Labor Supply Center at Yuba City earned average cash wages of 82 cents per hour, \$7.10 per day, and \$37.30 for the week ended September 1, 1945. Wage information was obtained from these workers in one of several surveys covering Labor Supply Centers in California. Data covered all farm work done by these workers during the survey week. Yuba City is located in the center of the "Peach Bowl," the leading California area in production of canning peaches. Of the 181 workers included in the sample, 72 were picking peaches, 38 picking prunes and smaller numbers were engaged in other operations or in harvesting other crops. Two-thirds of the workers were male and one-third female.

Workers picking peaches averaged 7.6 hours per day, 5.2 days per week, or 39 hours during the reporting week. They averaged daily cash wages of \$7.30 and weekly cash wages of \$38.00. Ninety-seven percent of the workers picking peaches were paid piece rates, averaging 12 cents per box. Male workers, whose hourly earnings averaged 96 cents, picked slightly fewer boxes of peaches an hour than the female workers, whose hourly earnings averaged 99 cents. Female workers often picked the low hanging peaches while the men used ladders to pick those on higher branches.

There was little difference between the wages earned by men and women picking prunes during the survey week. All workers averaged 8.5 hours per day, 5.2 days per week, and 44 hours per week in this operation. Although the prune pickers worked longer hours than the peach pickers, their average daily and weekly earnings were lower. The prune pickers earned average cash wages of \$5.90 a day and \$30.60 a week. The average rate paid for picking prunes was 30 cents per box.

Michigan sugar beets:

Workers harvesting sugar beets in the Saginaw-Bay City area of Michigan earned cash wages averaging 65 cents an hour, and \$4.80 per day during the week ended October 27, 1945. These preliminary results are from an enumerative sample survey made by the Bureau of Agricultural Economics during an active week of sugar beet harvesting. Farmers interviewed gave wage information for 529 workers, 91 percent of whom were pulling and topping sugar beets at an acre wage rate. These workers were paid an average of \$17.60 an acre, but rates varied depending on the yield per acre. Each pulled and topped, on the average, slightly less than one-third of an acre of sugar beets per day. Four percent of the workers were hauling sugar beets in their own trucks at an average rate of \$1.65 per ton. The truckers hauled 10.6 tons per day and earned an average of \$17.50 a day which included payment for the use of the truck.

The sugar beet harvesters worked an average of 7.4 hours a day, 2.7 days a week, or 20 hours a week on the reporting farms. Adverse weather conditions were a factor in the short work week. Sixty-five percent of all workers surveyed were men. Average hourly earnings of women pulling and topping sugar beets were very close to those of men doing this work, and the men worked only slightly longer hours per day. Forty-five percent of all workers were

UNITED STATES DEPARTMENT OF AGRICULTURE
Bureau of Agricultural Economics

Mexicans and 29 percent were prisoners of war.

Michigan potatoes.

Cash wages earned by workers harvesting potatoes in Otsego County, Michigan averaged 46 cents an hour and \$3.70 a day during the week ended October 13, 1945. These preliminary results are from an enumerative sample survey made by the Bureau of Agricultural Economics of 411 workers harvesting potatoes during an active week of potato harvesting. Ninety-four percent of the workers were picking up potatoes, while 6 percent were digging, loading, and hauling the potatoes. Of the workers picking up potatoes, 76 percent were paid at piece rates which averaged 9 cents per bushel. The other workers picking up potatoes were paid either hourly rates or daily rates, averaging 48 cents per hour or \$3.30 per day.

Workers harvesting potatoes during the survey week worked an average of 8.0 hours per day and 3.4 days per week, or 27 hours a week on the farm enumerated. Fifty-five percent of the workers were male. The male workers picking up potatoes at a bushel rate earned an average of 45 cents an hour, while females doing this work averaged 35 cents an hour. These hourly earnings are lower than those of pickers paid hourly rates. However, many of the workers paid by the bushel were school children, who were let out of school to assist in the harvest work. Ninety-six percent of all the potato harvesters were local workers. Some perquisites in addition to cash wages were given to 45 percent of the workers.

Louisiana sugar cane:

Sugar cane harvesters in Assumption and Iberia Parishes, Louisiana earned average cash wages of 47 cents per hour and \$21.60 per week. These preliminary results are from an enumerative sample survey made by the Bureau of Agricultural Economics of farms which employed 2,006 workers in the sugar cane harvest during the week ended November 17, 1945. Seventy percent of the workers were Negroes and 16 percent were prisoners of war. About 80 percent of all workers surveyed were men. All of the female workers were Negroes.

Sugar cane harvesters worked an average of 8.4 hours per day, 5.6 days per week, or 46 hours per week on the reporting farm. Over 70 percent of the workers were cutting the sugar cane or doing cutting in combination with other sugar cane work. Other workers were crossing or piling, loading or hauling. Of the workers cutting sugar cane, 64 percent were paid on a per ton basis at an average rate of \$1.17. Eighty-eight percent of all the workers were hand laborers and 12 percent were operating harvesting machines. There was no appreciable difference in the hourly earnings of machine operators compared with hand laborers. Most of the workers received transportation or housing in addition to their cash wages. Only a few were furnished meals.
